📘 PROJECT REPORT

AI Life Goal Planner (GUI-Based Smart Scheduler)

🧾 1. Introduction

In today's fast-paced life, students often struggle to manage their time and organize their goals effectively. This project, **AI Life Goal Planner**, is designed to help users plan their weekly goals in a simple and smart way.

The application takes user inputs such as goals, time required, and priority level, and generates a structured weekly plan. It acts like a basic AI assistant that helps users distribute their tasks efficiently throughout the week.

🎯 2. Objective

The main objectives of this project are:

- To create a simple and interactive goal planning system
- To help users manage their time effectively
- To simulate basic AI decision-making using logic and priority
- To build a beginner-friendly GUI application using Python

🛠️ 3. Technologies Used

- **Programming Language:** Python
- **GUI Library:** Tkinter
- **Concepts Used:**
    - Lists and Dictionaries
    - Functions
    - Conditional Statements
    - Sorting Algorithms
    - Basic AI Logic (priority-based scheduling)

⚙️ 4. Working of the Project

The project works in the following steps:

1. User enters goal details:
    - Goal name
    - Time required (hours per week)
    - Priority (High / Medium / Low)
2. Each goal is stored in a structured format (dictionary).
3. Goals are sorted based on priority using weighted logic.
4. The system distributes goals across 7 days of the week.
5. A weekly plan is generated and displayed in the GUI.
6. The system also provides smart suggestions based on priority.

🧠 5. AI Logic Used

Although this is a beginner-level project, it includes basic AI-like behavior:

- **Priority-based decision making**
- **Time allocation logic**
- **Balanced scheduling algorithm**

This makes the system smarter than a random planner.

🖥️ 6. Features

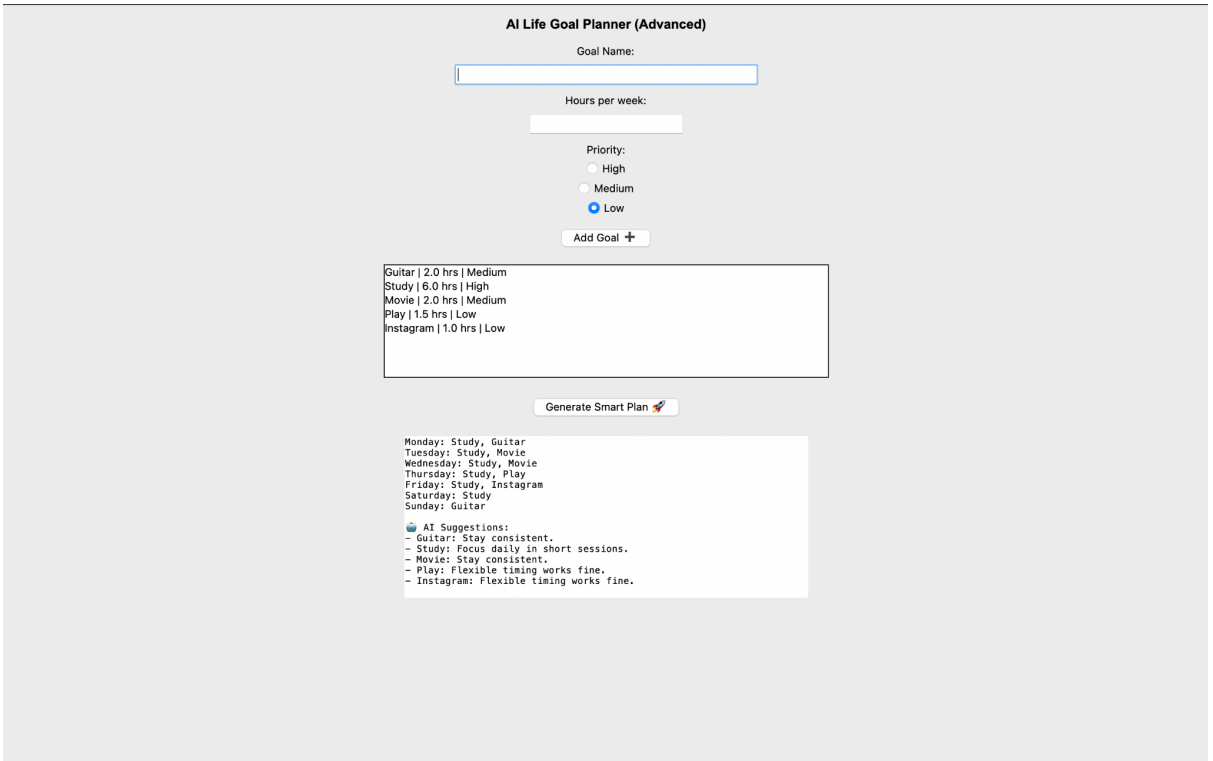
- User-friendly GUI interface
- Add multiple goals dynamically
- Custom time input for each goal
- Priority selection for each task
- Smart weekly schedule generation
- AI-based suggestions
- Error handling for invalid inputs

📊 7. Sample Output

Example:

Monday: Study, Guitar
Tuesday: Study, Movie
Wednesday: Study, Movie
Thursday: Study, Play
Friday: Study, Instagram
Saturday: Study
Sunday: Guitar

📸 8. Screenshots



- Input Screen
- Goal Added List
- Generated Weekly Plan

⚠️ 9. Limitations

- Does not use real machine learning models
- Scheduling is basic and not fully optimized
- No data saving functionality
- No user login system

🚀 10. Future Enhancements

- Add progress tracking system
- Save and load plans
- Add graphs using matplotlib
- Convert into mobile/web application
- Use real AI/ML for better planning

✅ 11. Conclusion

The AI Life Goal Planner successfully demonstrates how basic programming and logic can be used to create a smart planning tool. It helps users organize their weekly goals efficiently and improves productivity.

This project also helped in understanding GUI development and applying problem-solving skills in a real-world scenario.
